The Deep Water Sampler is a large volume liquid and water sampler that is ideal for sampling at large depths. Now available in 1 and 2.5 liter sizes. It is simple and easy to use in rivers, lakes or large deep containers. It takes a sample at the point you start pulling the handle up.

Transparent plastic construction means the sample can be easily viewed inside. It is ideal for fast stratified liquid sampling

DEEP WATER SAMPLER

QUALITY - Made from lightweight but robust Plexiglas (plastic)

ROPE - Supplied with a 15m rope.

| Stock # | Diameter mm | Height mm | Volume mm |
|----------------------|-------------|------------|-------------|
| 675 5079A1000 | 100 | 280 | 1000 |
| 675 5079A2500 | 130 | 320 | 2500 |

SIMPLE OPERATION

The simple operation means you simply lower the sampler to the required depth and then pull it out. As the sampler is lowered both the top and bottom valve opens allowing liquid to flow through. When you pull up the rope they valves close trapping the sample inside.

Note: Due to manufacturing methods this sampler cannot be dis-assembled for cleaning. It is suitable for general industrial and environmental sampling and not for hygienic sampling.
